HERE'S HOW IT WORKS

1. Incoming fluid is piped to water inlet.
2. Fluid flows directly to mold.
3. After circulating through mold channels, fluid is directed up the flow tube through the fitting ③ and the flow is regulated by the control valve ④.
4. Fluid is then returned to the tower, chiller or temperature controller.

THERMOMETER is directly in the fluid flow for quick accurate readings.

BRASS REGULATOR VALVES have a small seat diameter for accurate precise flow adjustments.
